

# Second Opportunity

I purchased a camera lens at Els Encants and attached it to a flashlight to give the user the ability to focus the light beam.

# Process

I used a piece of cork as as surface for both the lens and the flashlight to stick onto with superglue. Light would spill out ofrom the cracks between each piece, so I wrapped it up with electrical tape.

Final

# “Shine a little light”

## INTRODUCING THE NEW FLASH LENS

Developed from vintage camera lens technology, the flash lens brings new functionality to the flashlight. By using the focus, zoom, and aperture rings of the lens, you can adjust the intensity, diffusion, and shape of the beam of your flashlight respectively.
